PU 12 003/1 z: New design

The MANN-FILTER fuel filter PU 12 003/1 z is now available in a new design, consisting of **two parts**: a classic filter element and an additional bayonet ring.

The split in two parts enables an easy mounting and demounting process. For mounting the filter element will be put into the housing cup; alignment and positioning of the element is not necessary, because this function will be ensured by the white bayonet ring.

The bayonet ring is easy to handle thanks to the design split from the filter element. The ring will be put on top of the filter cup and turned until stop. MANN-FILTER recommends MFPI 182 for a detailed guide of the (de-) mounting and the mounting video. Both can be found in our online catalogue: [PU 12 003/1 z](#)
