

Due to the nature of remanufacturing, there is inevitably variance in the appearance of each finished product.

SMPE has taken care to ensure this product functions correctly, and each remanufactured part is subject to functionality tests, and comes with a serialised test certificate which shows the result of each of these tests.

The remanufacturing process includes:

- Stripping all components
- Sorting and disposing of any components which are not usable
- Extensive cleaning using a variety of methods (the cooler element is chemically cleaned to break down carbon deposits)
- High pressure air line removal of any residual carbon deposits

Inevitably, there will be cosmetic differences between units which does not affect the functionality or performance

Please see below photos for typical examples of remanufactured products
